

DRIP

This preparation allows to obtain a light and clean cup as the filter retains the insoluble solids during the extraction.

Drip preparation method that perfectly combines technical perfection and elegant design

How to do it?

For every 100 ml of water, add 6 grams of coffee. It is recommended not to exceed 500ml for a 6 cup Chemex.

Mesure

Prepare

We place the filter on top and moisten it with hot water to clean flavors and possible impurities. Later we empty the water

We place the ground coffee on top of the filter and level the coffee bed (not to exceed 5 cm in height)

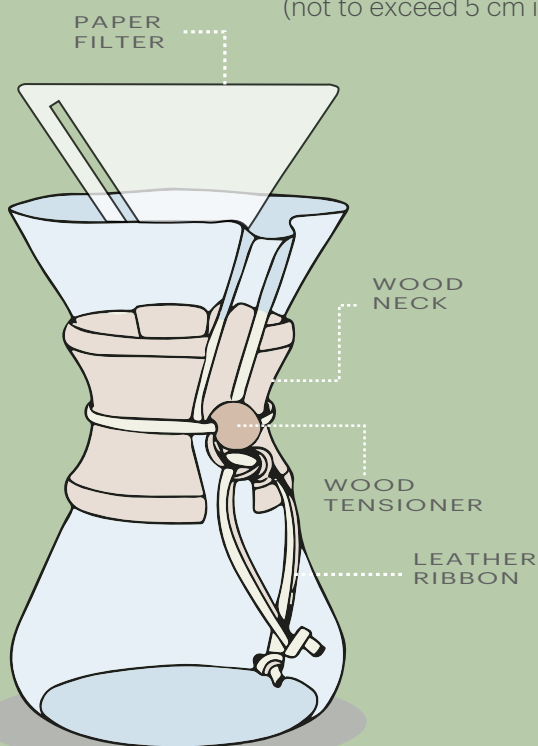

Fill

For the pre-infusion, pour water between 92-94°C and rest for 30 seconds (this part is preferably done with twice as much water as the grammage of coffee). For the infusion, we continue to pour water in a circular way following a single direction (do not pour in one time, but divide the total amount in about 3-4 steps)

Infuse

Remove the filter, stir the drink to mix the extraction and enjoy the coffee.

Serve

CHEMEX

Six Cup Classic Chemex

Light roast
Medium-Coarse grind
